

Business Continuity Plan

PrimeCore Minerals | Secure Multi Office Network

PC-07 | Version 0.1 | 23 September 2026

Status: Proposed plan for exercise

Owner: Project Lead | Approver: Project lead | Approval date: Pending

Keep essential PrimeCore communications and information services available during an outage. This plan covers the IT services in the project. Site safety and operational plant control remain under the responsible site procedures.

Activation and command

The project lead activates this plan when an outage is likely to exceed the service targets below, when a site becomes unavailable, or when compromise makes normal operations unsafe. The IT Administrator may begin urgent containment, records the reason and informs the lead. The backup lead takes over if the lead cannot be reached.

Service	Proposed impact tolerance	Continuity method
Incident communications	Alternate channel within 30 minutes	Verified phone contact tree and offline incident record
HQ connectivity	Restore target 4 hours; maximum tolerable outage 8 hours	Approved alternate connection or controlled remote working
Identity and protected files	Restore target 8 hours; maximum tolerable outage 24 hours	Prioritise essential users and approved read-only working copies
Monitoring visibility	Restore target 8 hours; maximum tolerable outage 24 hours	Manual source-log checks and incident notes
Historical logs	Restore target 24 hours; maximum tolerable outage 48 hours	Preserve local logs and document gaps

These are proposed business impact assumptions, not measured service commitments. The lead and service owners must confirm essential business processes, staffing, financial impact, critical periods and dependencies before adoption. Data-loss targets are defined in PC-06.

Roles and contact readiness

Project lead: incident declaration, priorities and stakeholder updates. IT Administrator: technical assessment and recovery. Backup administrator: alternate responder. Data owners: prioritise and accept information recovery. Site coordinator: account for local users and facilities. Maintain names, primary and backup phone numbers and availability in a restricted offline contact sheet; complete and test it before activation.

Continuity actions and return to service

1. Within 15 minutes of awareness, confirm people are safe, record the affected services and time, and use a known independent contact channel. Do not ask staff to bypass site safety controls to restore IT.
2. Assess duration, affected locations, data integrity and dependencies. The lead declares the incident, assigns an owner and communicates the operating mode and next update time.
3. Start approved workarounds: alternate communications, prioritised tasks, and approved remote access where available. Use only authorised copies of business data and record offline changes for reconciliation.
4. For ransomware or suspected data compromise, isolate affected systems and preserve evidence under PC-14. Do not reconnect backups or distribute possibly compromised files merely to resume work.
5. Run PC-10 for infrastructure restoration. Communicate every 30 minutes for Critical incidents and every two hours for High incidents, following SEC-03. Use plain impact statements and a realistic next update time.
6. After technical validation, data owners reconcile offline work and confirm access and content. Restore users in stages, monitor for recurrence, and let the lead authorise return to normal operations.

Scenario playbooks

- Internet or firewall outage: confirm the fault boundary, use the contact tree, prioritise network recovery, and test routing and policy before broad restoration.
- HQ premises unavailable: the site coordinator confirms safe access arrangements; the lead approves alternate work locations and trusted devices. Do not presume the proposed Azure VPN is available.
- Identity or file service outage: suspend unsafe workarounds involving shared administrator accounts; recover dependencies and restore approved data.
- Monitoring outage: record a visibility gap, check local firewall logs manually and preserve rotating records while the collector is recovered.

Exercise and acceptance

Run a tabletop exercise each term and after major design changes. Simulate an unreachable primary administrator, one site outage and failed email delivery. Record declaration time, contacts reached, workaround capacity and decisions. Acceptance requires a usable contact tree, owner-approved impact tolerances and a successful recovery exercise. Assign findings to owners and due dates.
