

Email Policy

PrimeCore Minerals | Secure Multi Office Network

PC-11 | Version 0.1 | 23 September 2026

Status: Proposed policy for approval

Owner: IT Administrator | Approver: Project lead | Approval date: Pending

Control PrimeCore email use, sensitive information handling and monitoring notifications. The demonstrated Gmail route is a lab notification channel; it does not establish an organisation-wide email platform.

User responsibilities

- Use approved accounts for business communications. Keep personal and business credentials separate, use unique passwords and enable the approved MFA method where supported.
- Verify external recipients and link permissions before sending confidential material. Prefer access-controlled links over unrestricted attachments. Send only the minimum information the recipient needs.
- Treat unexpected credential requests, payment changes, QR codes and attachments as unverified. Confirm through a previously known contact channel. Report suspicious messages without forwarding dangerous content to colleagues.
- Do not automatically forward business email to personal accounts. Do not send passwords, MFA codes, recovery keys or raw incident evidence in ordinary email.
- Report misdirected messages immediately, recording recipients, time and material type. Restrict shared links if authorised; do not assume recall has removed every copy.

Monitoring email baseline

On 13 September 2026, HQ-MONITOR sent manual and R06 event-triggered Grafana notifications through Gmail using TCP 587, mandatory STARTTLS and certificate verification. The documented contact point is PrimeCore IT Admin. Credential values must remain secret. Mailbox receipt is evidenced; administrator acknowledgement and escalation are not. [S2–S4]

The final firewall rule for changing Gmail destinations still needs capture. A stable approved relay would support a narrower destination policy. Do not present successful mail tests as proof of the final firewall rule, all-recipient delivery or guaranteed notification timing.

Mail administration and validation

- Restrict SMTP credentials and configuration to the service account and authorised administrators. Rotate credentials after suspected exposure and record the dependent service restart and test.
- Approve sender identities, recipients and external forwarding. Maintain a backup notification channel independent of the monitored host and email route.
- For any future organisational domain, assign an owner to validate the provider's supported sender authentication, anti-malware and account recovery controls before acceptance. No such domain configuration is evidenced in this pack.
- Store business records in approved repositories and apply the relevant retention schedule. Mailbox synchronisation and trash recovery must not be treated as an independently tested backup. Include required mailbox data in backup scope once a platform is selected.

Security notification contents

Include incident or alert ID, severity, source system, affected resource, event and dispatch times with timezone, observed outcome and a restricted evidence link. Avoid sensitive file content and credentials. State the acknowledgement deadline under SEC-03. The administrator must accept ownership explicitly in the incident register.

Acceptance tests and records

Test	Required result
Manual notification	Application reports success and intended mailbox receives it
Controlled event alert	Correct rule, source and count reach the intended recipient
Missed acknowledgement	Backup responder receives escalation at the approved deadline
Delivery failure	Retry record and alternate-channel notification are demonstrated
Recovery of selected mail record	Authorised retrieval produces readable content and attachments

Keep actual test times, recipients, message reference, result and evidence. The first two paths have limited existing evidence; escalation, alternate-channel delivery and mailbox recovery require execution. A Grafana resolved message changes alert state, not the human incident closure decision.

Review and exceptions

The owner reviews this document every six months and after a significant incident or system change. Record exceptions with the affected asset, business reason, risk, compensating control, approver and expiry. Approval does not replace a successful implementation test.

Screenshot evidence appendix

These figures record selected laboratory observations. They support the tested functions described in this artefact. Proposed policies, untested controls and organisational approval remain separate from the pictured results.

Figure E1 Firing notification received

The rule-specific email reports A=19 and C=1 for source 192.168.11.100. Receipt demonstrates notification delivery, but not human acknowledgement or escalation.

© 2026 Grafana Labs. Sent by Grafana v13.2.1.

The resolved email records NoData handling. A=-1 and C=-1 are state indicators, not negative event counts, and automated resolution does not close an incident.
