

Incident Response Management Plan

PrimeCore Minerals | Secure Multi Office Network

PC-14 | Version 0.1 | 23 September 2026

Status: Proposed response plan with one evidenced test cycle

Owner: IT Administrator | Approver: Project lead | Approval date: Pending

Coordinate detection, investigation, containment, recovery and closure for PrimeCore security incidents. This plan joins the technical SEC-01 to SEC-05 procedures to accountable human response.

Response team

Role	Responsibility
Incident lead or IT Administrator	Accept ownership, investigate, coordinate containment and maintain the timeline
Backup administrator	Respond when primary is unavailable and use a clean account if primary is compromised
Project lead	Approve broad disruption, prioritise continuity and coordinate stakeholder communication
Data or service owner	Assess impact and accept recovered data or service
Evidence custodian	Restrict original evidence, maintain hashes, transfers and holds

Enter named primary and alternate responders, verified phone numbers, approved email addresses and availability in the restricted SEC-03 contact register. High and Critical timing assumes staffed coverage. Until coverage and fallback are tested, these are proposed targets rather than service levels.

Severity and examples	Dispatch and acknowledgement	Escalation
Critical: privileged compromise, destructive or widespread activity	Within 1 minute; acknowledge within 10 minutes	Backup and lead at 10 minutes
High: suspicious privileged access, repeated authentication failures	Within 1 minute; acknowledge within 30 minutes	Backup at 30 minutes; lead at 60
Medium: repeated blocked network activity without proven compromise	Within 5 minutes; acknowledge within 4 business hours	Backup at 4 business hours; lead next business day
Low: isolated blocked event or benign mistake	Record; daily digest; next business day review	Increase severity if evidence changes

Business hours are 09:00–17:00 Monday to Friday, Australia/Brisbane, excluding local public holidays. High and Critical clocks run continuously. Acknowledgement starts at notification dispatch and requires an explicit incident-record entry. [S5]

Response workflow and current evidence

1. Detect and register: create an incident ID, retain the original alert and record event, receipt and dispatch times with timezone. Distinguish blocked traffic, successful access and unknown outcomes.
2. Triage and acknowledge: assign an owner, check asset and identity context, review approved tests, and set severity from impact and evidence. Confirm account ownership through an independent known channel.
3. Contain: isolate the narrowest affected device, account or flow; record reason, authority, impact and rollback. Preserve volatile information when practical without delaying urgent protection.
4. Preserve evidence: export raw logs and relevant configuration, calculate SHA-256 hashes and record collector, method and time. Keep originals restricted, use copies for analysis and maintain transfer history under SEC-04.
5. Eradicate and recover: remove the cause, rotate affected credentials, verify session termination where supported, restore clean data under PC-10 and test expected access.
6. Close and learn: monitor for at least 24 hours after restoration, obtain service-owner acceptance, record root cause and residual risk, and assign corrective actions. The lead reviews High and Critical closure.

Known validation incident

INC-001 on 13 September 2026 was authorised R06 testing from 192.168.11.100 to 192.168.99.1. Nine records remained Normal; approximately 19 produced scheduled firing and a received email. A later NoData state and resolved email demonstrate automatic alert resolution. Named administrator acknowledgement, investigation completion and incident closure remain unrecorded. Do not classify this test as a confirmed intrusion. [S3–S4]

Escalation and evidence records

Follow SEC-03 for reminders, delivery retries and the alternate channel. Correlate related notifications while retaining each event; a severity increase must still notify. Required incident fields: ID, affected assets, classification, severity, owner, acknowledgement time, evidence links, actions and times, approvals, escalation, recovery checks, closure rationale and follow-up owners.

Exercise criteria

Demonstrate one controlled detection, an explicit human acknowledgement, an unacknowledged test escalation, failed mail delivery with fallback, and accepted recovery. Reconcile source and collector clocks before claiming latency. Use safe test accounts and label all exercise messages. Review this plan each term and after any major incident.

Screenshot evidence appendix

These figures record selected laboratory observations. They support the tested functions described in this artefact. Proposed policies, untested controls and organisational approval remain separate from the pictured results.

Figure E1 Firing notification received

The rule-specific email reports A=19 and C=1 for source 192.168.11.100. Receipt demonstrates notification delivery, but not human acknowledgement or escalation.
