

Passwords and authorisation

PrimeCore Minerals

Account protection and permission decisions

Identity and permission

Authentication checks who you are.

Authorisation checks what you may do.

A successful sign-in does not grant access to every resource.

Unique passphrases

Use a different password for every account.

Proposed baseline: at least 15 characters where supported.

Store secrets in an approved password manager.

MFA and recovery

Use the approved additional authentication method.

Decline and report a prompt you did not initiate.

Keep recovery codes separate and private.

Access for your role

Use an ordinary account for daily work.

Use a separate approved account for administration.

Request temporary access with an owner and expiry.

Lockouts and recovery

Stop repeated attempts when a login keeps failing.

Contact IT through the known recovery route.

IT verifies identity and the cause before restoring access.

Scenario: a colleague needs your login

A colleague needs a file but lacks access.

They ask to use your account for a few minutes.

What should happen instead?

Knowledge check and completion

Complete the six-question PC-16 quiz in Slide Show mode.

Record your first-answer score and review the explanations.

Ask the facilitator about any missed scenario.
